

“Text Image to Text Converter Using Google Cloud platform and Vision API”

- By Anirudha Nilegaonkar

Email: anirudha.nilegaonkar@gmail.com

-It is a small article on text image to text converter using GCP (Google Cloud Platform) and google Vision API.

It includes:

1. Creating Virtual Machine on Google Cloud Platform.
2. SSH Connection from local machine to VM on Google Cloud Platform.
3. Setting up Vision API credentials.
4. Python code for conversion.

Step 1:

-Create account on Google Cloud Platform.

-Go to <https://cloud.google.com/> to open an account.

Step 2:

-After creating account successfully. Go to Compute Engine>VM instances and create VM with Ubuntu OS.

For tutorial on VM Creation check the below link:

<https://cloud.google.com/compute/docs/quickstart-linux>

We will use SSH for connecting Local Machine to Cloud VM:

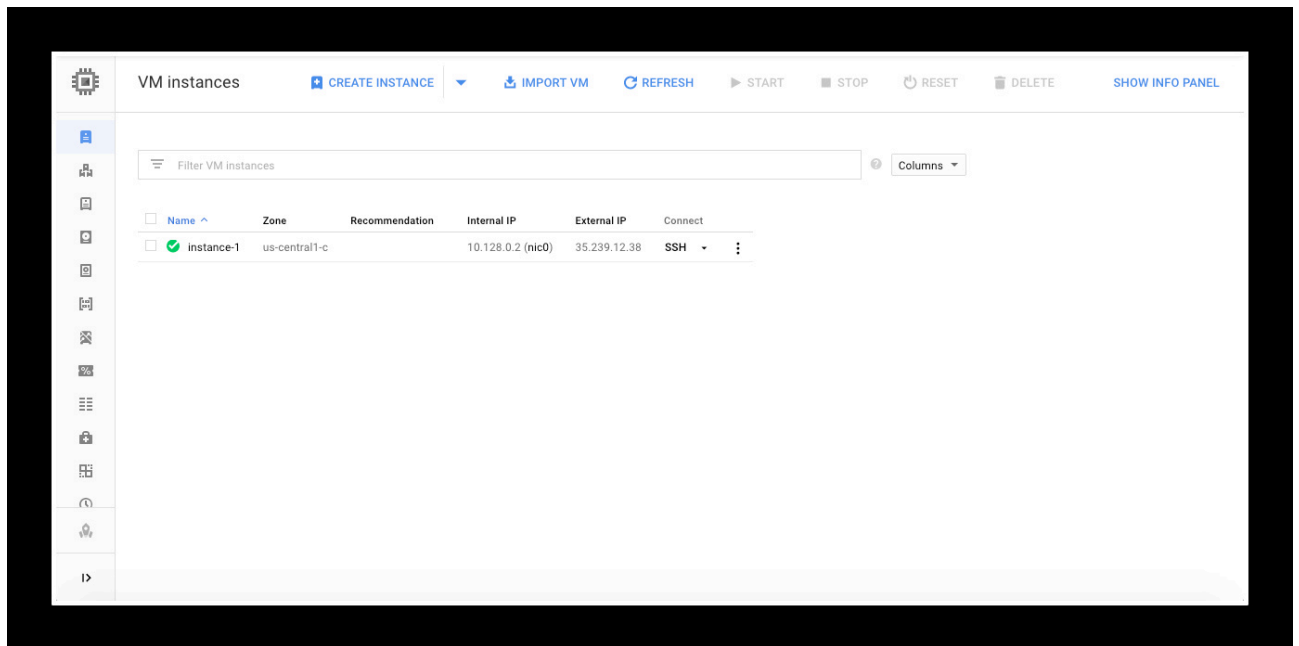

SSH Instructions for Windows User:

1. Download Putty

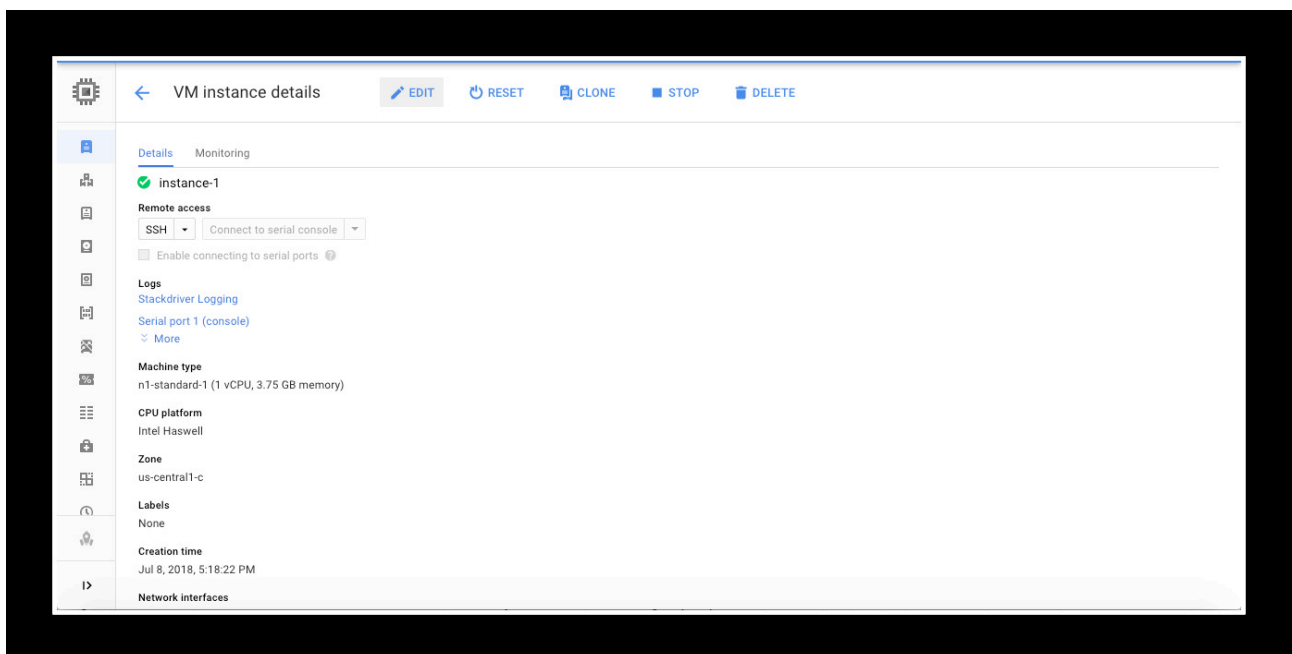

2. Open Putty Key Generator

- Click on generate key
- You can change Key Comment field with your project name.
- Copy Complete Key value.

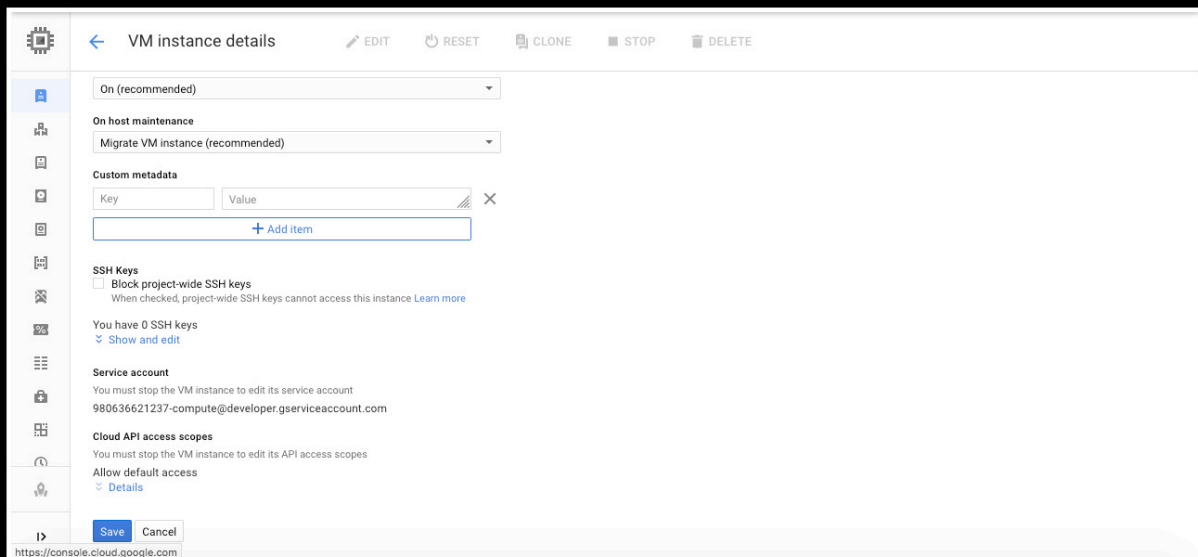

3. Now open VM instance

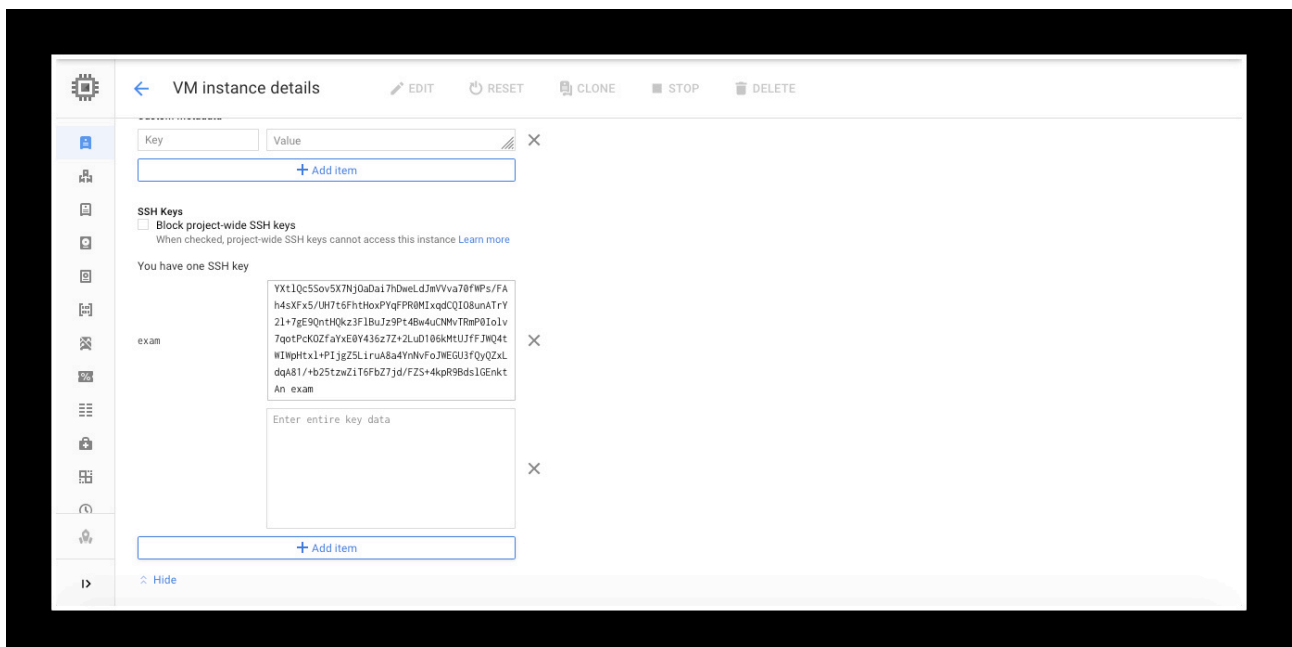

- Click on instance-1 (Whatever name you have given to VM instance)

- Click on Edit

-In SSH keys section click on “show and edit” option

-Paste Public key here.

-Allow HTTP and HTTPS traffic and click on save.

4. Save Public and Private keys in Putty Key Generator. (It saves in the form of files)

5. In Putty Configuration window go to SSH > Auth and browse private key file that you already saved in your system.

6. In Putty Configuration window go to Session enter external IP address of VM instance and Hit Enter...It's done.....

SSH Instructions for Mac/Linux User:

1. Generating Public key

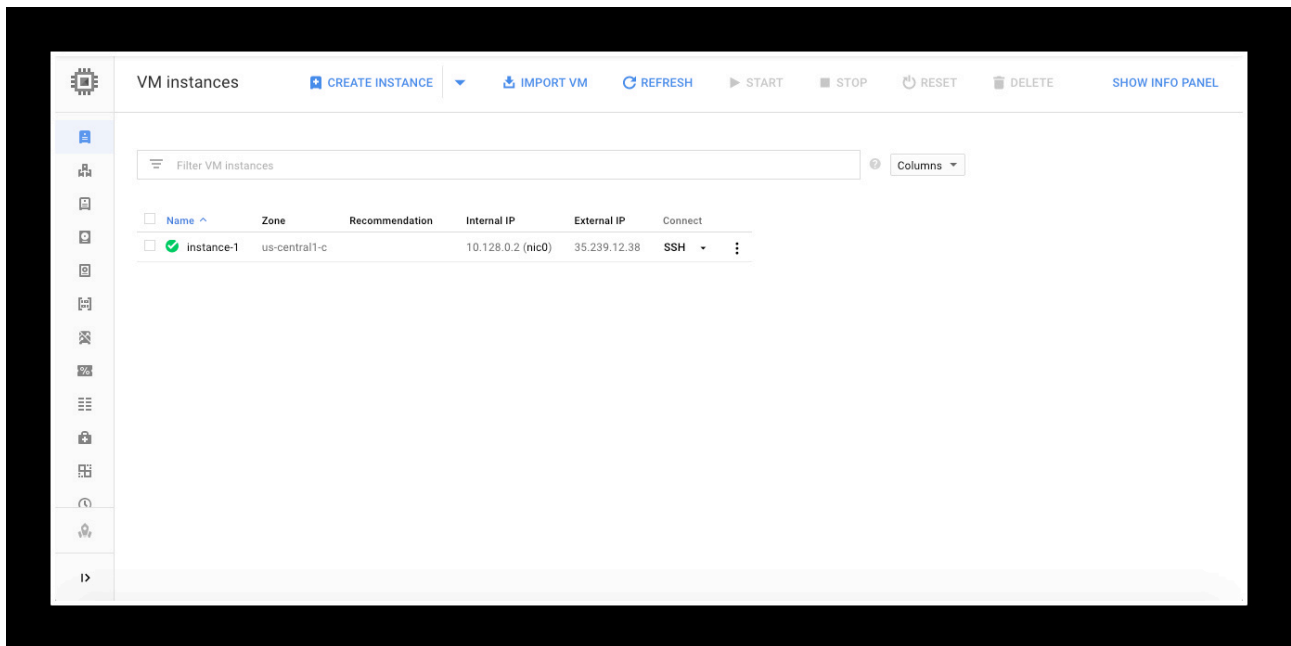

- On CLI enter following command: “ ssh-keygen -t rsa -f ~/.ssh/gc_rsa -C exam ”
It will create gc_rsa.pub in .ssh folder which contains public key. Where “exam” is project name and “-C” is attribute for comment.

```
[Anirudhas-MacBook-Pro:~ AndyNile$ ssh-keygen -t rsa -f ~/.ssh/gc_rsa -C exam
Generating public/private rsa key pair.
Created directory '/Users/AndyNile/.ssh'.
[Enter passphrase (empty for no passphrase):
[Enter same passphrase again:
Your identification has been saved in /Users/AndyNile/.ssh/gc_rsa.
Your public key has been saved in /Users/AndyNile/.ssh/gc_rsa.pub.
The key fingerprint is:
SHA256:VWgV7itXya2P9Hy0VMWMdZB7aFBuZcgVJ0JecSIGqHM exam
The key's randomart image is:
+----[RSA 2048]-----+
|  ..=0+BX|
|  o=,==**|
|  .. 0,00,|
| o E. .,=,|
| oS  0,0++|
|    + o.|
|    +..|
|    *..|
|    =|
+-----[SHA256]-----+
```

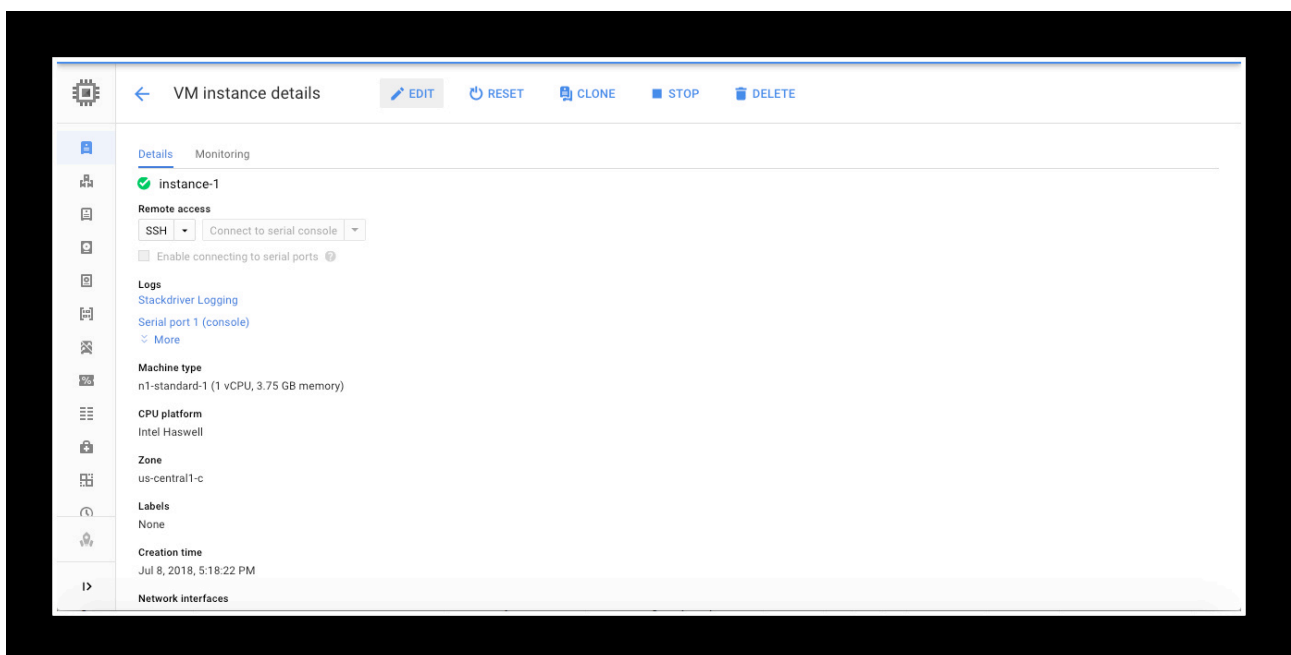

2.Copy public key from gc_rsa.pub file

```
Anirudhas-MacBook-Pro:~ AndyNile$ cd ~/.ssh
Anirudhas-MacBook-Pro:~.ssh AndyNile$ ls
gc_rsa      gc_rsa.pub
Anirudhas-MacBook-Pro:~.ssh AndyNile$ vi gc_rsa.pub
```

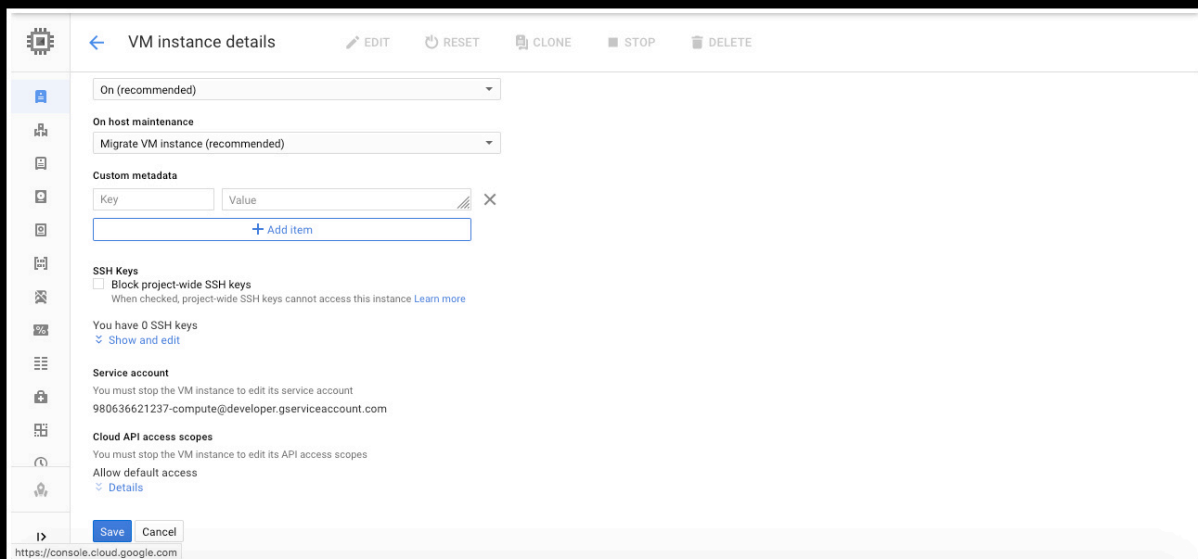

3.Now open VM instance

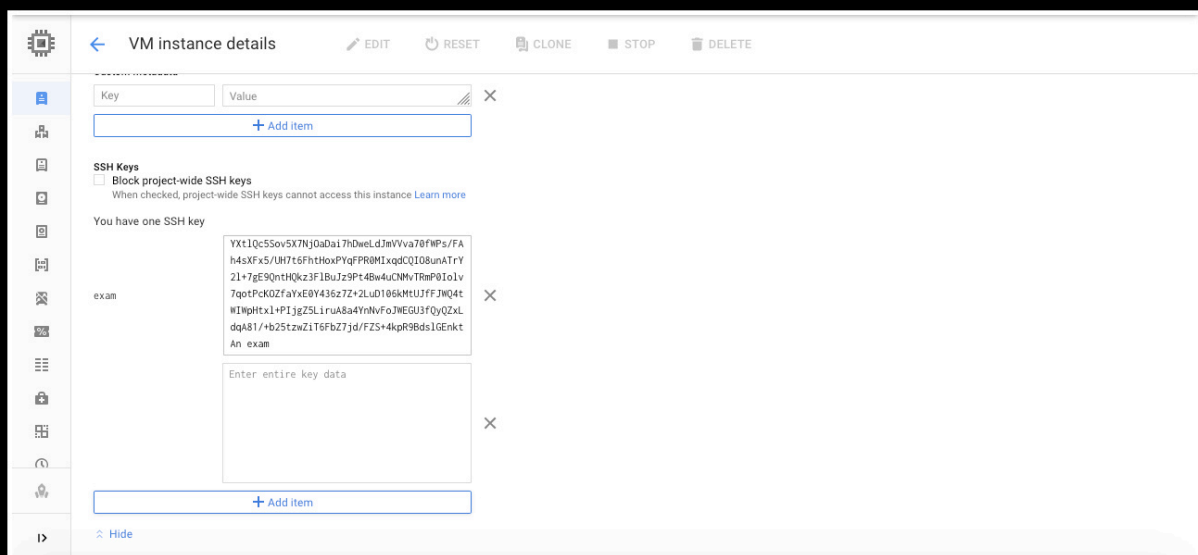

- Click on instance-1(Whatever name you have given to VM instance)

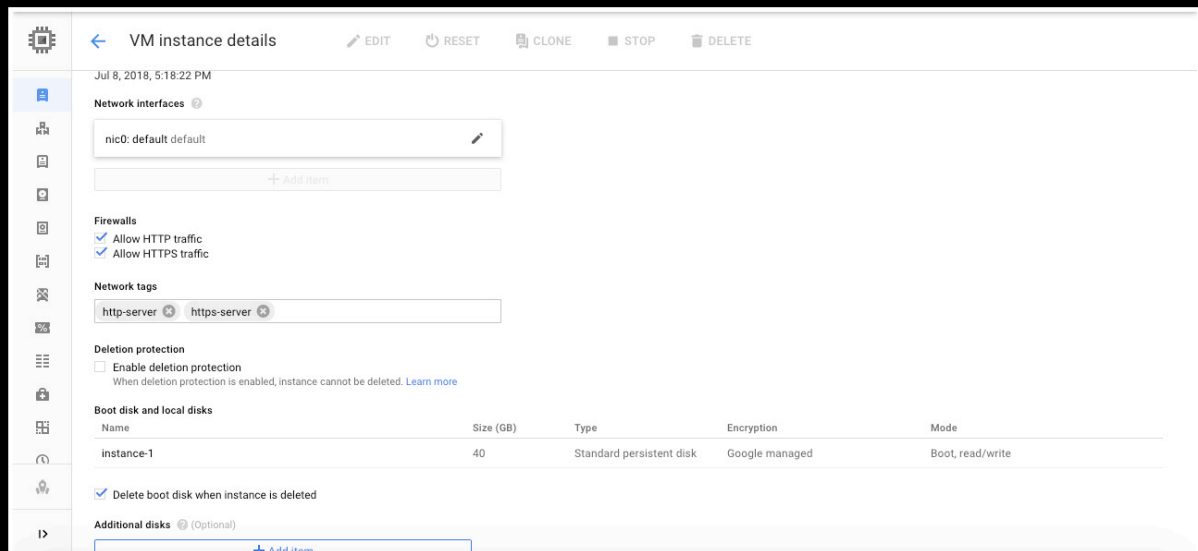

-Click on Edit

-In SSH keys section click on “show and edit” option

-Paste Public key here and click on save.

-Allow HTTP and HTTPS traffic.

4. Now on CLI enter command “`chmod 400 gc_rsa`” to give read permission to `gc_rsa` file.

5. Let's try connecting this VM instance from your Machine.

On CLI enter command “`ssh -i Public_key_Filename GCP_ProjectName @instance_external_IP`”.

```
[Anirudhas-MacBook-Pro:~$ ssh -i gc_rsa exam@35.239.12.38
The authenticity of host '35.239.12.38 (35.239.12.38)' can't be established.
ECDSA key fingerprint is SHA256:Pg0TmXe6SCmrQ08dNu5RaYKbWJsf5xHs+bLB7S2Fckw.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '35.239.12.38' (ECDSA) to the list of known hosts.
Welcome to Ubuntu 16.04.4 LTS (GNU/Linux 4.13.0-1019-gcp x86_64)

0 packages can be updated.
0 updates are security updates.

The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by
applicable law.

WARNING! Your environment specifies an invalid locale.
The unknown environment variables are:
LC_CTYPE=UTF-8 LC_ALL=
This can affect your user experience significantly, including the
ability to manage packages. You may install the locales by running:

    sudo apt-get install language-pack-UTF-8
    or
    sudo locale-gen UTF-8

To see all available language packs, run:
apt-cache search "^language-pack-[a-z][a-z]$"
To disable this message for all users, run:
    sudo touch /var/lib/cloud/instance/locale-check.skip

[exam@instance-1:~$ ls
```

Step 3:

- We are connected to VM instance.
- In VM instance create a directory to install all required files.
- Go into this newly created directory.
- We will install python packages,
“ sudo apt-get install python-pip ”
- We will install google cloud vision API,
“ sudo pip install google-cloud-vision”
- Now we have to create API Key on GCP. So, go to APIs & Services > Credentials. After that go to Create Credentials > Service Account Key. In Service account key section select service account as new service account and do rest changes as per below screenshot.

← Create service account key

Service account
New service account

Service account name ? Role ?
APIKey Owner

Service account ID
api-key @exam-164420.iam.gserviceaccount.com

Key type
Downloads a file that contains the private key. Store the file securely because this key can't be recovered if lost.
☒ JSON
Recommended
☐ P12
For backward compatibility with code using the P12 format

Create Cancel

After clicking on Create button you will get a .json file. Save that file in local machine.

-Now we have to copy the contents of the downloaded .json file to paste it in our server machine.

- 1.Copy contents of .json file.
- 2.In VM Instance create .json file and paste contents in it.

```
exam@instance-1:~$ sudo pip install google-cloud-vision
The directory '/home/exam/.cache/pip/https' or its parent directory is not owned by the current user and the cache has been disabled. Please check the permissions and owner of that directory. If executing pip with sudo, you may want sudo's -H flag.
The directory '/home/exam/.cache/pip/' or its parent directory is not owned by the current user and caching wheels has been disabled. Check the permissions and owner of that directory. If executing pip with sudo, you may want sudo's -H flag.

Requirement already satisfied: certifi<=2017.4.17 in /usr/local/lib/python3.5/dist-packages (from requests<3.0.0dev,>=2.18.0->google-api-core[grpc]<2.0.0dev,>=0.1.0->google-cloud-vision) (2018.4.16)
Requirement already satisfied: urllib3<1.24,>=1.21.1 in /usr/local/lib/python3.5/dist-packages (from requests<3.0.0dev,>=2.18.0->google-api-core[grpc]<2.0.0dev,>=0.1.0->google-cloud-vision) (1.23)
Requirement already satisfied: idna<2.0,>=2.5 in /usr/local/lib/python3.5/dist-packages (from requests<3.0.0dev,>=2.18.0->google-api-core[grpc]<2.0.0dev,>=0.1.0->google-cloud-vision) (2.7)
Requirement already satisfied: cachetools<=2.0.0 in /usr/local/lib/python3.5/dist-packages (from google-auth<2.0.0dev,>=0.4.0->google-api-core[grpc]<2.0.0dev,>=0.1.0->google-cloud-vision) (2.1.0)
Requirement already satisfied: rsa>=3.1.4 in /usr/local/lib/python3.5/dist-packages (from google-auth<2.0.0dev,>=0.4.0->google-api-core[grpc]<2.0.0dev,>=0.1.0->google-cloud-vision) (3.4.2)
Requirement already satisfied: pyasn1-modules<=0.2.1 in /usr/local/lib/python3.5/dist-packages (from google-auth<2.0.0dev,>=0.4.0->google-api-core[grpc]<2.0.0dev,>=0.1.0->google-cloud-vision) (0.2.2)
Requirement already satisfied: pyasn1<=0.1.3 in /usr/lib/python3/dist-packages (from rsa>=3.1.4->google-auth<2.0.0dev,>=0.4.0->google-api-core[grpc]<2.0.0dev,>=0.1.0->google-cloud-vision) (0.1.9)
pyasn1-modules 0.2.2 has requirement pyasn1<0.5.0,>=0.4.1, but you'll have pyasn1 0.1.9 which is incompatible.
Installing collected packages: google-cloud-vision
Successfully installed google-cloud-vision-0.32.0
exam@instance-1:~$ nano api_key.json
exam@instance-1:~$ ls
api_key.json
exam@instance-1:~$
```

This .json file contains private key for secure connection to APIs.

-Let's connect to API by using following command:

“export GOOGLE_APPLICATION_CREDENTIALS=~/.Path of your .json file”

```
exam@instance-1:~$ ls
api_key.json
exam@instance-1:~$ export GOOGLE_APPLICATION_CREDENTIALS=~/.google_cloud/api_key.json
exam@instance-1:~$
```

-After doing this your server may not work even after restart. So now we will update .profile file.

-open .profile file and paste,

“export GOOGLE_APPLICATION_CREDENTIALS=~/.Path of your .json file” at the end of file.

-Now to update this change in entire system enter command “source ~/.bashrc”.

Step 4:

-Now everything is done at background. Our VM is ready and We installed Vision API on it. It's time to write python code.

-First download the image that you want to convert into text. Use “wget Image_address” to download it from web. (Copy image address by right clicking on image)

For example, This is the input image we want to Convert:

```
exam@instance-1:~/google_cloud$ wget https://www.brainyquote.com/photos_tr/en/h/hjacksonbrownjr/382774/hjacksonbrownjr1-2x.jpg
